## #IAQCROSSAMERICA

### Steril-Aire commits to an action campaign for clean and healthy air

Burbank, CA, 1BApril 4, 2022— Steril-Aire, a leader in the development of high-performance indoor air quality (IAQ) and ultraviolet germicidal irradiation (UVGI) technologies, announces the launch of an action campaign: #IAQAcrossAmerica that parallels the recent [Clean Air in Buildings Challenge](#) announcement from the EPA. Steril-Aire’s campaign is expected to provide education towards improving indoor air and delivering clarity about scientifically proven IAQ solutions. The Steril-Aire team is going to be partnering with businesses, facilities, and communities to supply indoor air building surveys to provide insight into a building’s health for its occupants.

*“I am deeply passionate about improving the air we breathe.” said Vertical Market Director, Josh Oelker. “As occupants we rarely individually control the air quality in the places we inhabit or frequent, yet poor air quality has detrimental effects that last a lifetime. At this moment we have a unique opportunity with #IAQAcrossAmerica to improve our way of life in this country for current & future generations.”*

Steril-Aire plans on sharing educational content via social media and their website regarding IAQ topics and the appropriate steps to take to improve your indoor air.

Steril-Aire launched the “UVC for HVAC” market in 1994. At the time, “Sick building syndrome” was a concern for many building owners and managers. Upon investigation, UVC’s germicidal qualities, when applied in HVAC systems, was shown to eliminate pathogens from air and surfaces, including coil fins. ISO certified in both 9001:2015 & 14001:2015, Steril-Aire held multiple pioneering patents throughout the history of the company and developed new and better ways to get the power of UVC directly where it needs to be in sufficient dosage to provide true solutions for the eradication of biological problems. Steril-Aire has always delivered the greatest UVC output in HVAC system conditions and according to the EPA and US Department of Homeland Security testing, generates a 6X disinfection advantage or more over any other UVC offering in the industry, even now almost 30 years after their high-powered emitters were first developed.
